

INTELLIGRADE

Predicting Student Academic Performance Using Data Analytics

INTRODUCTION

The problem statement

1

Many students experience academic difficulties because of poor study habits, lack of time management, and inconsistent attendance. Schools usually identify struggling students too late, which affects academic performance and student success.

LITERATURE REVIEW

What current solutions exist?

Existing Solutions

- Manual grade monitoring
- Learning management systems
- Academic advising programs

Research Gap

Most existing systems only monitor grades and do not use predictive analytics to identify at-risk students early.

METHODOLOGY

Your step-by-step plan

3

Proposed Solution

1. Collect student academic data
2. Analyze attendance and quiz scores
3. Apply data analytics techniques
4. Predict student performance
5. Provide academic recommendations

IMPLEMENTATION

Data visualizations or charts supporting your idea

Results & Data Visualization

- Pie Chart → Passing vs Failing Students
- Bar Graph → Study Hours vs Grades
- Line Graph → Attendance Trends
- Dashboard Mockup → Student Performance Analytics

Sample Result

The prediction model achieved high accuracy in identifying students who may need academic support.

CONCLUSION

The final impact

5

Using data analytics can help schools identify struggling students earlier, improve intervention strategies, and support better academic performance through data-driven decision-making.
